INSIGHTS CORNER

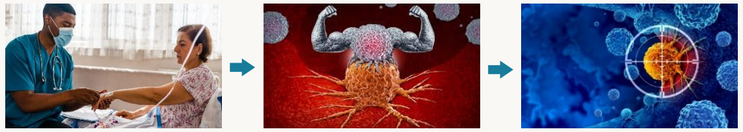

Antibody Drug Conjugate

The next big investment in oncology

INSIGHTS CORNER

Introduction: Immuno-Oncology

- Immuno-oncology, also known as immuno-oncologic therapies that strengthens the body's immune system to better detect and destroy cancer cells, either by enhancing its natural defenses or equipping immune cells with new tools to boost their effectiveness
- Immunotherapy is a form of biological therapy that uses substances derived from living organisms to help treat cancer

Approximately 30 companies are currently involved in immuno-oncology research and development, with a collective pipeline exceeding 40 therapeutic molecules

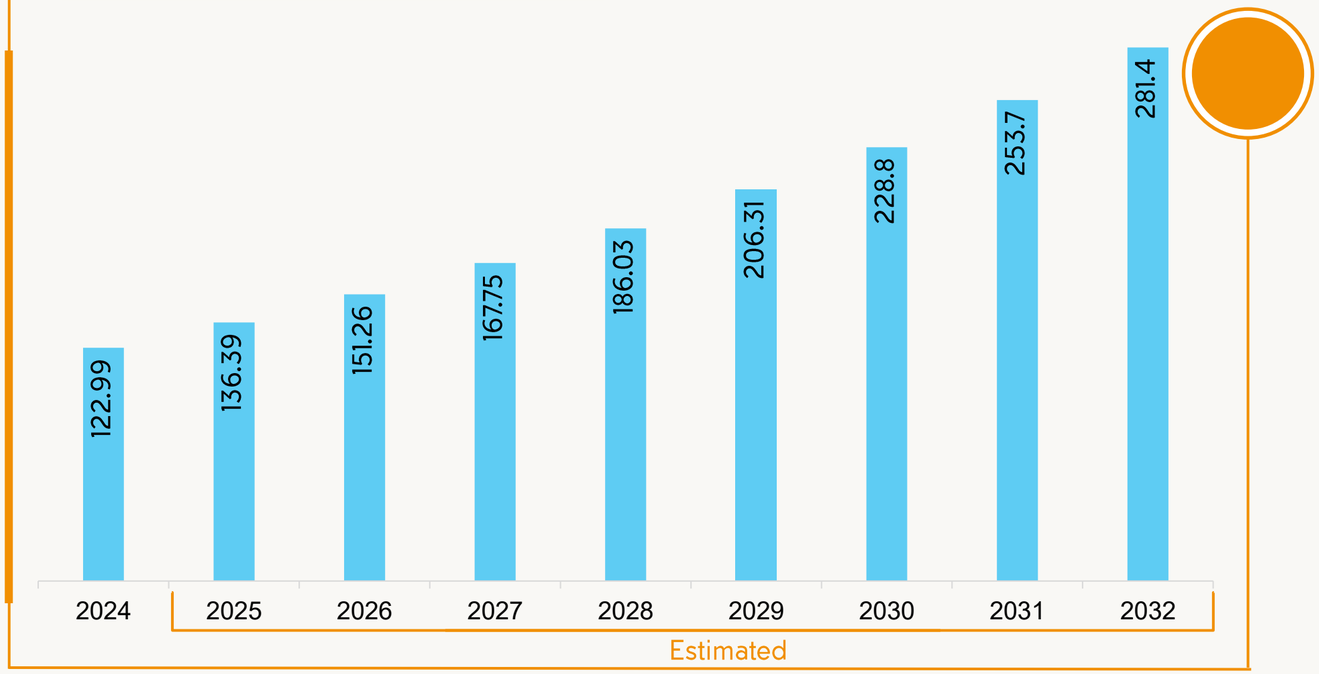

Source: Clinical trial.gov, As of July 2025 (2021-25)

Approaches

Immunotherapy is an umbrella term covering various treatments and approaches that harness the immune system to fight disease

1. Immune Checkpoint Inhibitors (e.g. mAbs)
2. Small Molecule Modulators (e.g. PD-1/PD-L1, IDO1
3. CAR (Chimeric Antigen Receptor) T-Cell Therapy
4. Oncolytic Virus (e.g. herpes simplex, adeno virus)
5. Cancer Vaccine (e.g. RNA, nano-vaccine)
6. Combination Therapy (e.g. combination immuno & radiotherapy)

Market size (2024-32)

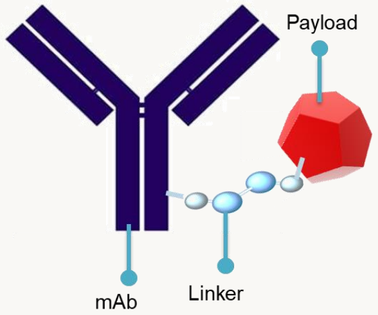

OCTAVUS CONSULTING

INSIGHTS CORNER

Introduction: Antibody Drug Conjugate

ADCs are targeted therapies that combine the specificity of monoclonal antibodies (mAb) with drugs. While ADCs are best known for their role in cancer therapy, their application is expanding into other disease areas.

Main Components of an ADC:

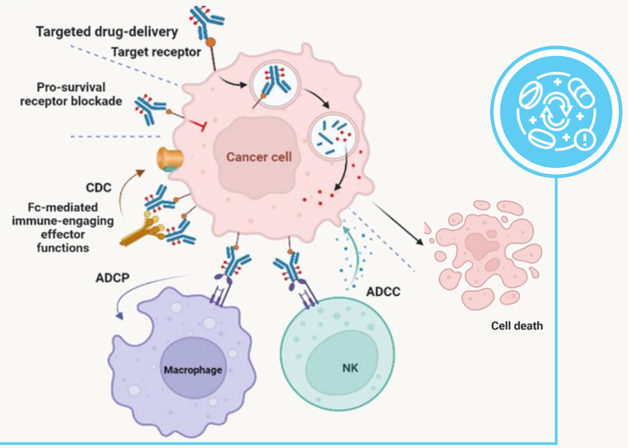

- Monoclonal Antibody
- Cytotoxic payload
- Linker

Mechanism of Action

The ADCs mechanism of action is similar across all diseases, with disease-specific variations depending on the target cell type and payload

Key steps:

- Target Binding
- Internalization
- Payload Release
- Cell Death or Modulation

Development of ADCs

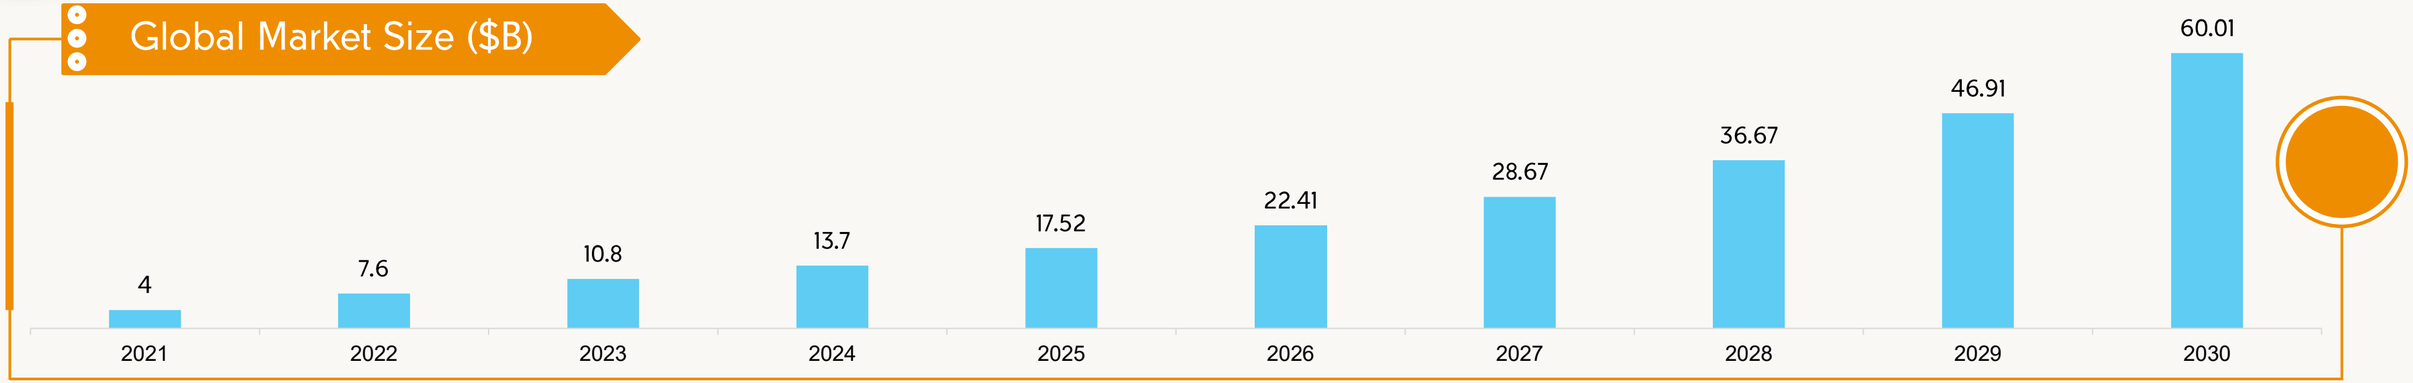

Generation	Key Features	Advantages	Disadvantages
First Generation	Murine Abs, non-cleavable linkers	New ADC concept	High toxicity, lack precise targeting
Second Generation	Humanized Ab, cleavable/stable linkers, improved payloads	Enhanced target selectivity, improved safety	ADC aggregation, Still some off-target toxicity, rapid clearance
Third Generation	Site-specific conjugation, uniform DAR, fully humanized Abs, optimized linkers	Less off-target toxicity, better stability, reduced immunogenicity, higher efficacy	Complex conjugation techniques, ongoing optimization needed

DAR: Drug-to-Antibody Ratio

INSIGHTS CORNER

Market Size: Antibody Drug Conjugate

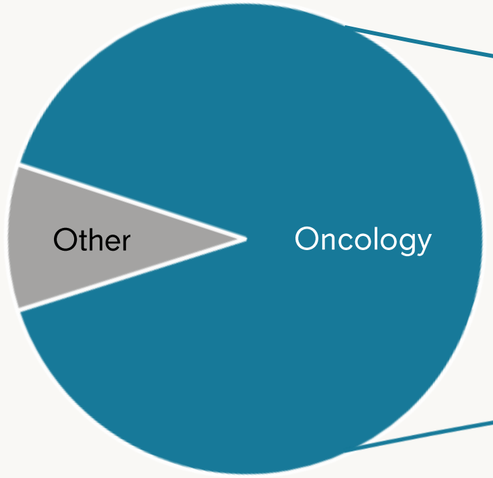

Global Market Size ($B)

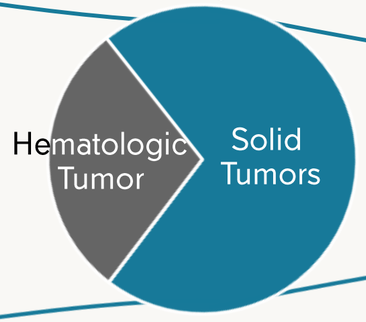

Therapeutic area Market Share

- Most ADCs are used for cancer, but new treatments for other diseases are being developed and will likely become more common in the future
- Personalized medicine and precision therapies are helping the ADC market grow quickly

Oncology holds 90% of the total market. Other therapeutic areas holds only 10% of the market

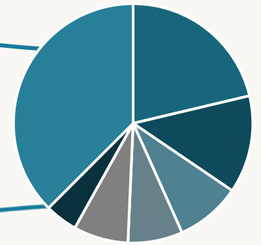

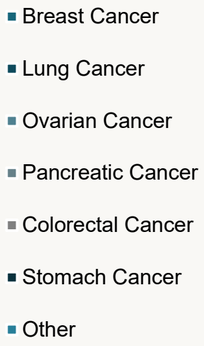

Oncology ADCs are divided into solid and hematologic tumors

Solid tumors: Holds 71% of the total oncology market

Hematologic tumors: Holds only 29% of the market

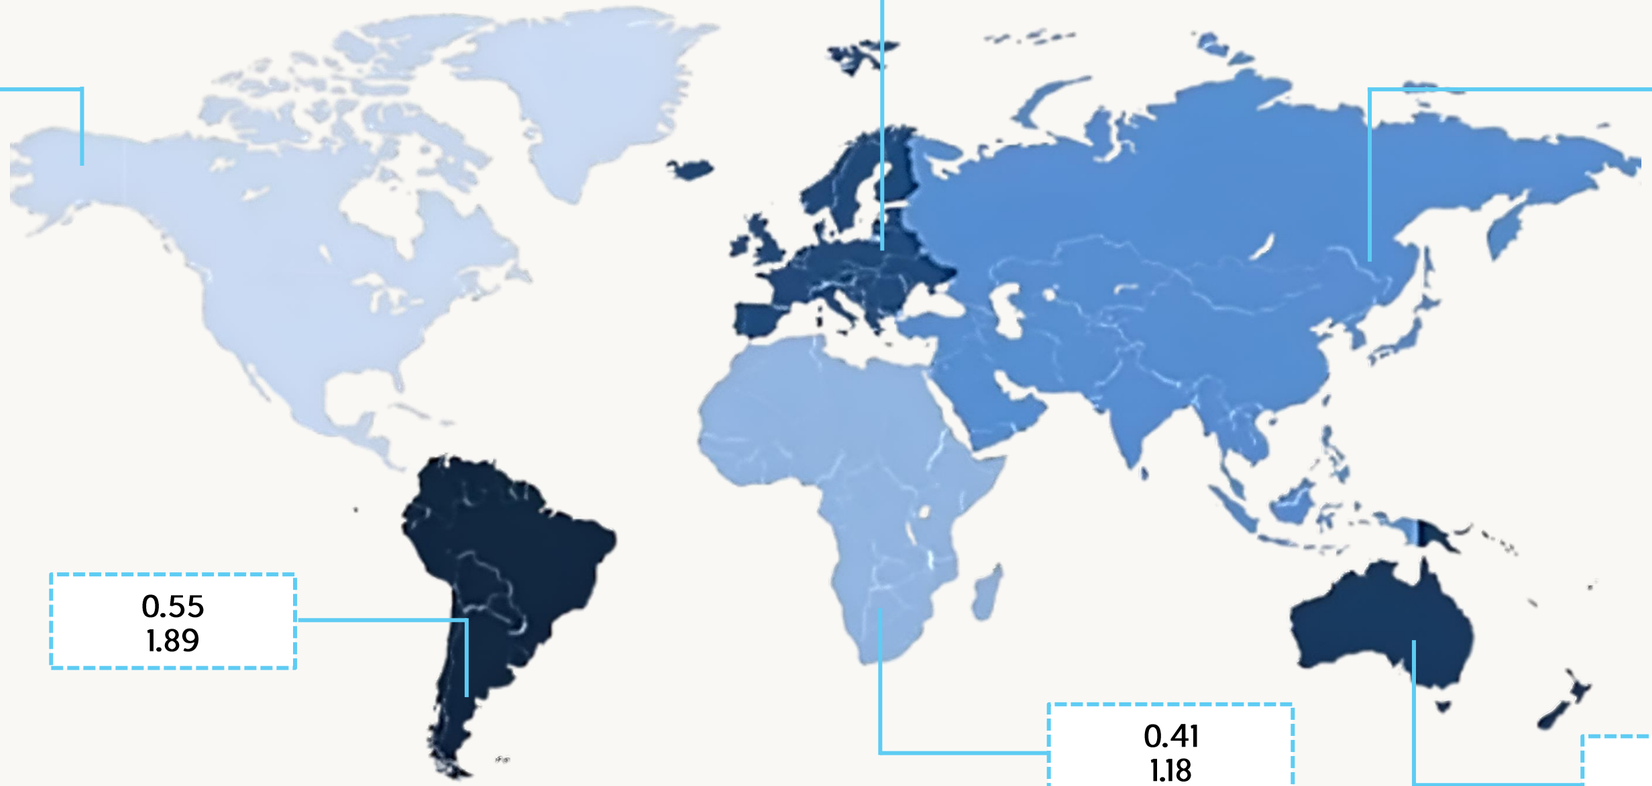

Breast cancer is the dominant indication with 21.3% market share of the total solid tumors

INSIGHTS CORNER

Market Trends: Current and Future of ADCs

Frontline Shift: ADCs + Advanced Backbone Therapies

- The biggest ongoing trend is the integration of ADCs with next-generation backbone therapies, particularly PD-1 x VEGF bispecifics, as standard first-line treatment for multiple cancers
- Recent large business development deals (e.g. Pfizer/3SBio, BioNTech/BMS) highlight industry confidence in PD-1/VEGF bispecifics
- Clinical data from major trials (e.g. Summit HARMONI, 3SBio SSGJ-707) showed favorable ORR and OS for PD-1/VEGF bispecifics, with patients and physicians likely to prefer these combinations due to their potential to lower cancer mortality by roughly 20%

Expanding Indications and First-Line Efficacy

- ADCs are moving robustly into frontline settings, with key trials demonstrating significant improvements in metastatic NSCLC and breast cancer:
  - Notable studies feature AZ's TROP2 ADC (NSCLC), AbbVie's C-met ADC, Gilead's Trodelvy plus Keytruda (35% lower progression risk in PD-L1+ TNBC), and AstraZeneca's ENHERTU for breast cancer
  - New targets like HER3 x TROP2, biparatopic HER2, FOLRα ADCs are driving expansion into multiple solid tumor types

Payload and Linker Innovation

- There is elevated buyer focus on diverse payloads and linker technologies, moving beyond established compounds like TOPO1 and MMAE
- The market is watching for innovative conjugation chemistry and novel cytotoxic payloads that offer improved efficacy and safety, alongside legacy ADC targets and formats

Big Pharma Deal Priorities

- Buyers continue to show interest in:
  - Buyers continue to focus on new molecular targets, high-science preclinical platforms, and ADCs with differentiated payload, linker, and conjugation strategies
  - Chinese pharmaceutical companies have recently shown strong interest in ADC partnerships and licensing, driven by favorable policies, faster regulatory approvals, and growing R&D capabilities

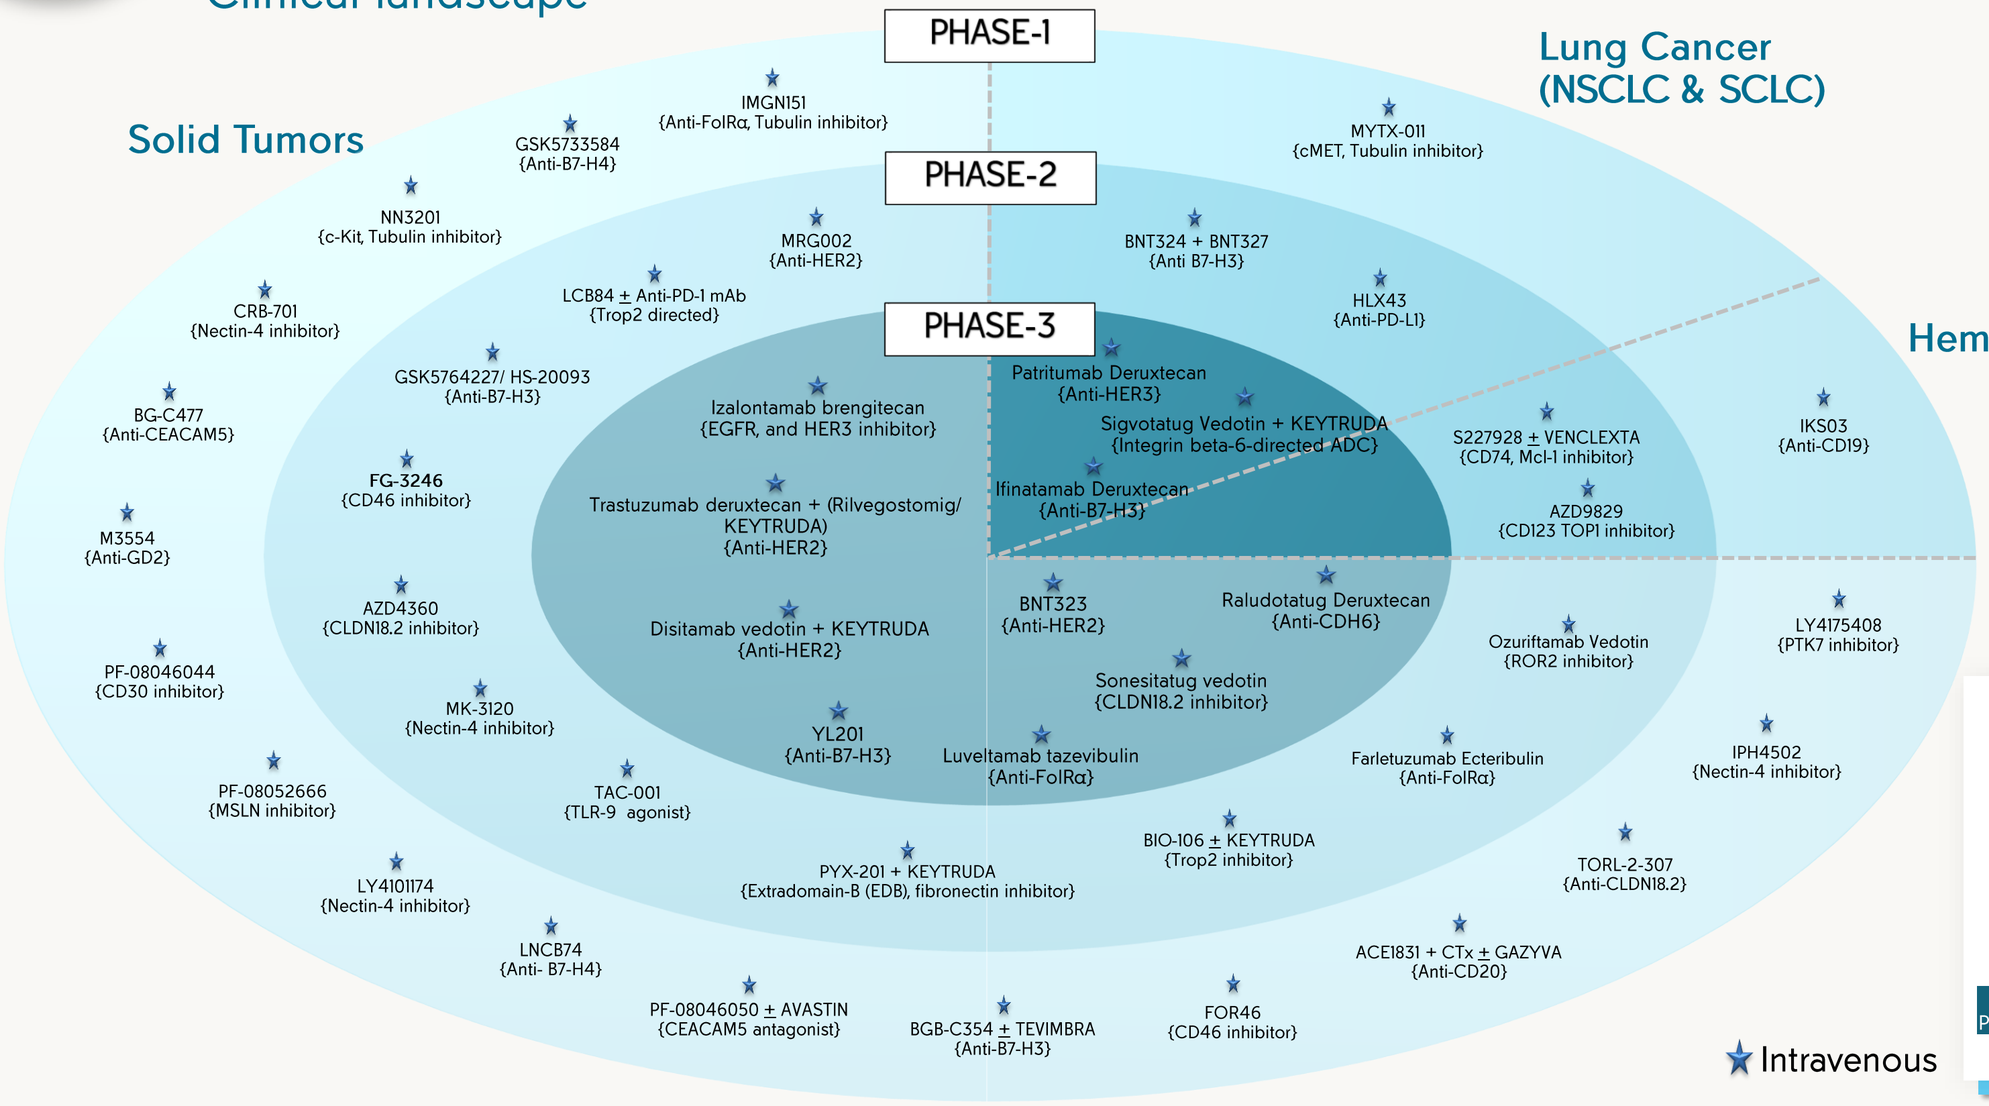

Evolving Endpoints: MRD, pCR, OS

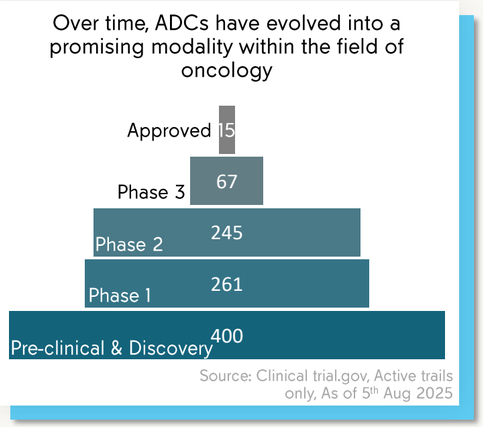

- Clinical trial endpoints are shifting: there is growing recognition that MRD (minimal residual disease) negativity is more predictive of overall survival in hematological cancers than conventional endpoints like PFS or pCR, which are less reliable in metastatic settings
- The industry is pushing for endpoint innovation in solid tumors to facilitate more robust regulatory approvals and patient-relevant outcomes

INSIGHTS CORNER

Conference 2025

American Association for Cancer Research (AACR) 2025 Updates

- Surge in Dual-Payload ADCs: AACR 2025 saw a significant rise in interest and presentations regarding dual-payload ADCs, with at least 15 such conjugates featured, marking the first clinical entry for some assets. Notably, Chengdu Kanghong's TROP2-targeting molecule KH815 began its Phase 1 trial, the first dual-payload ADC tested in humans. Western biotechs presenting include Acepodia, Sutro, and Araris
- ADC Therapeutics Presentations: Key preclinical investigations highlighted novel exatecan-based antibody drug conjugates:
  - Claudin-6 ADC (ADCT-242): For ovarian and NSCLC models, presented as both monotherapy and in combination
  - PSMA-targeted ADC (ADCT-241): Advanced for prostate cancer
  - ASCT2-targeted ADC (HuB14-VA-PL2202): Novel target for both solid and hematological cancers
- Comprehensive ADC Focus: AACR covered 311 key ADC abstracts (35 clinical, 263 preclinical), showing depth and breadth in both emerging platforms and translational advances

AACR American Association for Cancer Research ANNUAL MEETING 2025 CHICAGO
April 25-30

American Society of Clinical Oncology (ASCO) 2025 Updates

2025 ASCO ANNUAL MEETING
May 30- June 3

- Breakthrough Clinical Results: ASCO 2025 featured key updates shaping standards of care across breast, gastric, lung, and genitourinary (GU) cancers, with ten ADC presentations highlighted as "not to miss" for their practice-changing potential
- Genitourinary (GU) Cancers: Notable advances in bladder cancer from long-term trial follow-ups and new research directions were discussed, emphasizing systemic therapies and cross-specialty collaboration for early-stage disease management
- Non–Small Cell Lung Cancer: The rapid evolution of NSCLC treatment at ASCO was punctuated by newer ADCs with promising preliminary clinical results, with multiple agents and mechanisms in focus

Key Clinical Results

- ZYNLONTA (ADC Therapeutics) + Glofitamab in DLBCL:
  - In the LOTIS-7 Phase 1b trial, the combination showed an overall response rate (ORR) of 93.3% and a complete response (CR) rate of 86.7% among 30 evaluable patients. The trial is expanding to 100 r/r DLBCL patients; updated results are anticipated later in 2025
  - The combination was generally well tolerated, with a manageable safety profile and durable CRs seen in the majority of responders
  - The pivotal LOTIS-5 Phase 3 DLBCL trial aims to complete its progression-free survival target in late 2025, setting the stage for potential regulatory filings in 2026

INSIGHTS CORNER

Future: Emerging Directions in ADC

- ADCs are expected to greatly increase in use for cancer treatment by 2030 with market forecasts indicating a more than threefold market expansion by 2030
- Next-generation ADCs promise more precise, effective, and personalized treatments, reshaping the global oncology landscape and offering new hope for patients across cancer types

Novel ADC Technologies
- AI-driven innovation in ADCs
- Nanoparticle-enabled ADC systems

Technology

Next-Generation

Next-Generation ADCs
- Improved Linkers and Payloads
- Dual-Drug and Multi-Specific ADCs

Novel Therapeutic Strategies
- Pan-Cancer ADCs
- Bispecific ADCs
- Even Tri-specific

Novel Strategies

Expansion

Expansion of ADCs beyond oncology
- Infectious diseases
- Autoimmune diseases
- Neurological disorders
- Cardiovascular diseases and more

Booming Market Trends
- Approved molecules expansion
- Expanding market size rapidly
- The global market $13.7 B in 2024 and projected to $60.01 B by 2030

Market Trends

Personalization

Precision and Personalized Medicine
- Precise diagnosis and better patient selection
- Advanced biomarker strategies
- Combination therapies

INSIGHTS CORNER

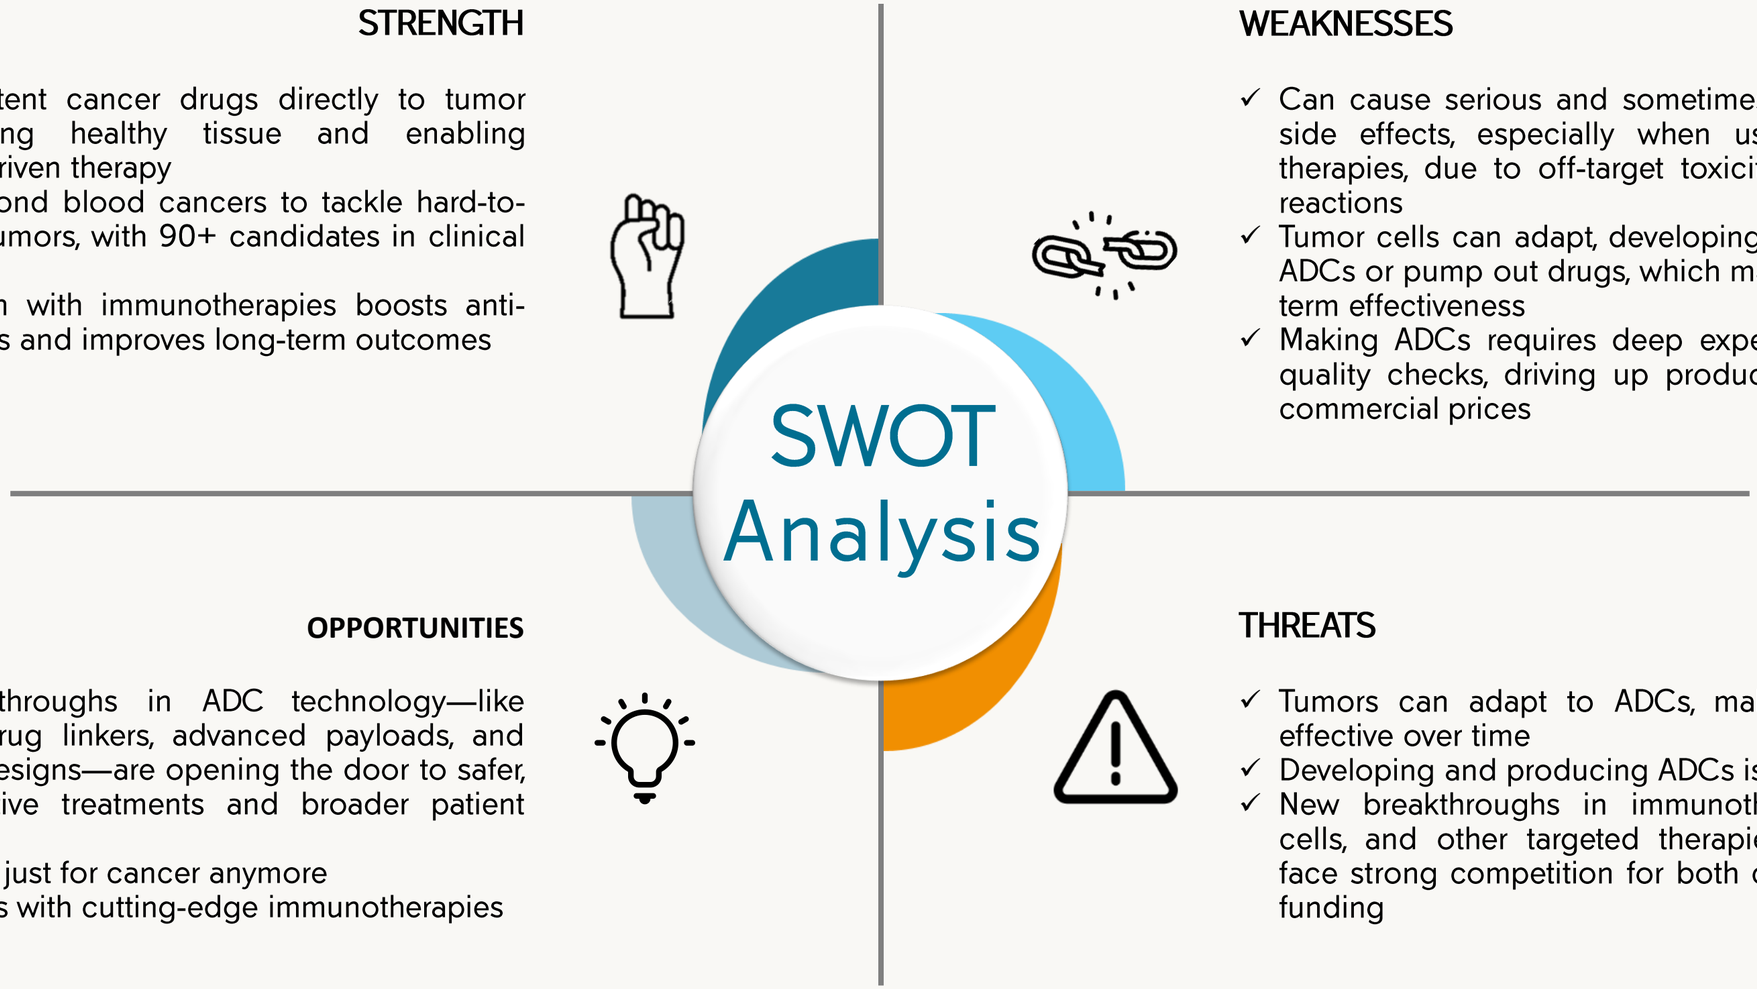

SWOT Analysis: Antibody Drug Conjugate

STRENGTH

- ✓ Delivers potent cancer drugs directly to tumor cells, sparing healthy tissue and enabling biomarker-driven therapy
- ✓ Moving beyond blood cancers to tackle hard-to-treat solid tumors, with 90+ candidates in clinical trials
- ✓ Combination with immunotherapies boosts anti-tumor effects and improves long-term outcomes

WEAKNESSES

- ✓ Can cause serious and sometimes unpredictable side effects, especially when used with other therapies, due to off-target toxicity and immune reactions
- ✓ Tumor cells can adapt, developing ways to evade ADCs or pump out drugs, which may reduce long-term effectiveness
- ✓ Making ADCs requires deep expertise and strict quality checks, driving up production costs and commercial prices

OPPORTUNITIES

- ✓ New breakthroughs in ADC technology—like improved drug linkers, advanced payloads, and bispecific designs—are opening the door to safer, more effective treatments and broader patient benefits
- ✓ ADCs aren't just for cancer anymore
- ✓ Pairing ADCs with cutting-edge immunotherapies

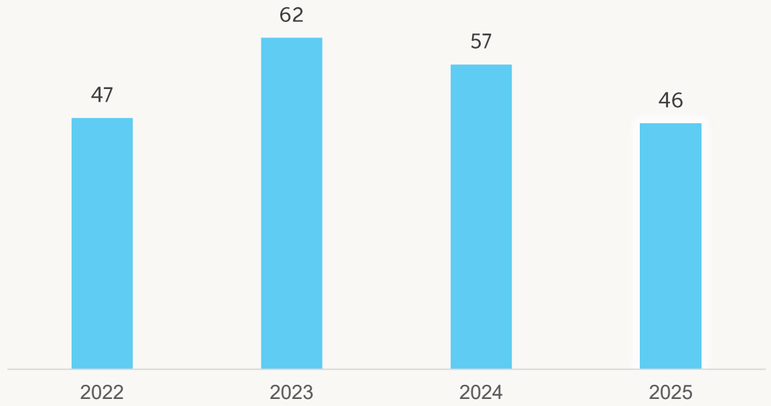

THREATS

- ✓ Tumors can adapt to ADCs, making them less effective over time
- ✓ Developing and producing ADCs is expensive
- ✓ New breakthroughs in immunotherapies, CAR-T cells, and other targeted therapies mean ADCs face strong competition for both clinical use and funding

INSIGHTS CORNER

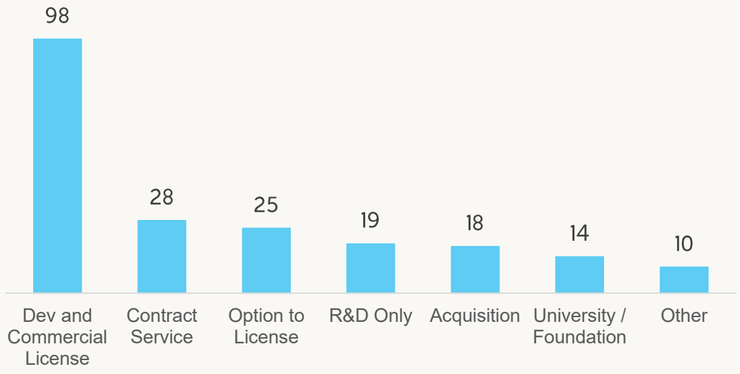

Deals Analysis: Antibody Drug Conjugate

ADCs: Number of Deal (2022-2025)

1. Proven Clinical Success & Expanding Pipeline:
   - With 15+ FDA-approved ADCs and over 100 candidates in clinical development, ADCs have demonstrated significant therapeutic and commercial value beyond conventional chemotherapy, reinforcing investor confidence and fueling robust pipeline growth
2. Innovation in Payloads & Technology:
   - Continuous advances in engineering linker chemistry, payload diversity, and bispecific/multispecific ADC designs promise differentiated, next-gen assets with improved clinical profiles, attracting investment seeking leadership in novel biotherapeutics
3. Broad Oncology Applicability & Market Expansion:
   - ADCs target both solid tumors and hematologic malignancies, with increasing penetration in frontline settings and diverse cancers. Coupled with improved diagnostic tools, the expanding patient population drives deal activity

ADCs: Number of Deal Type (2022-2025)

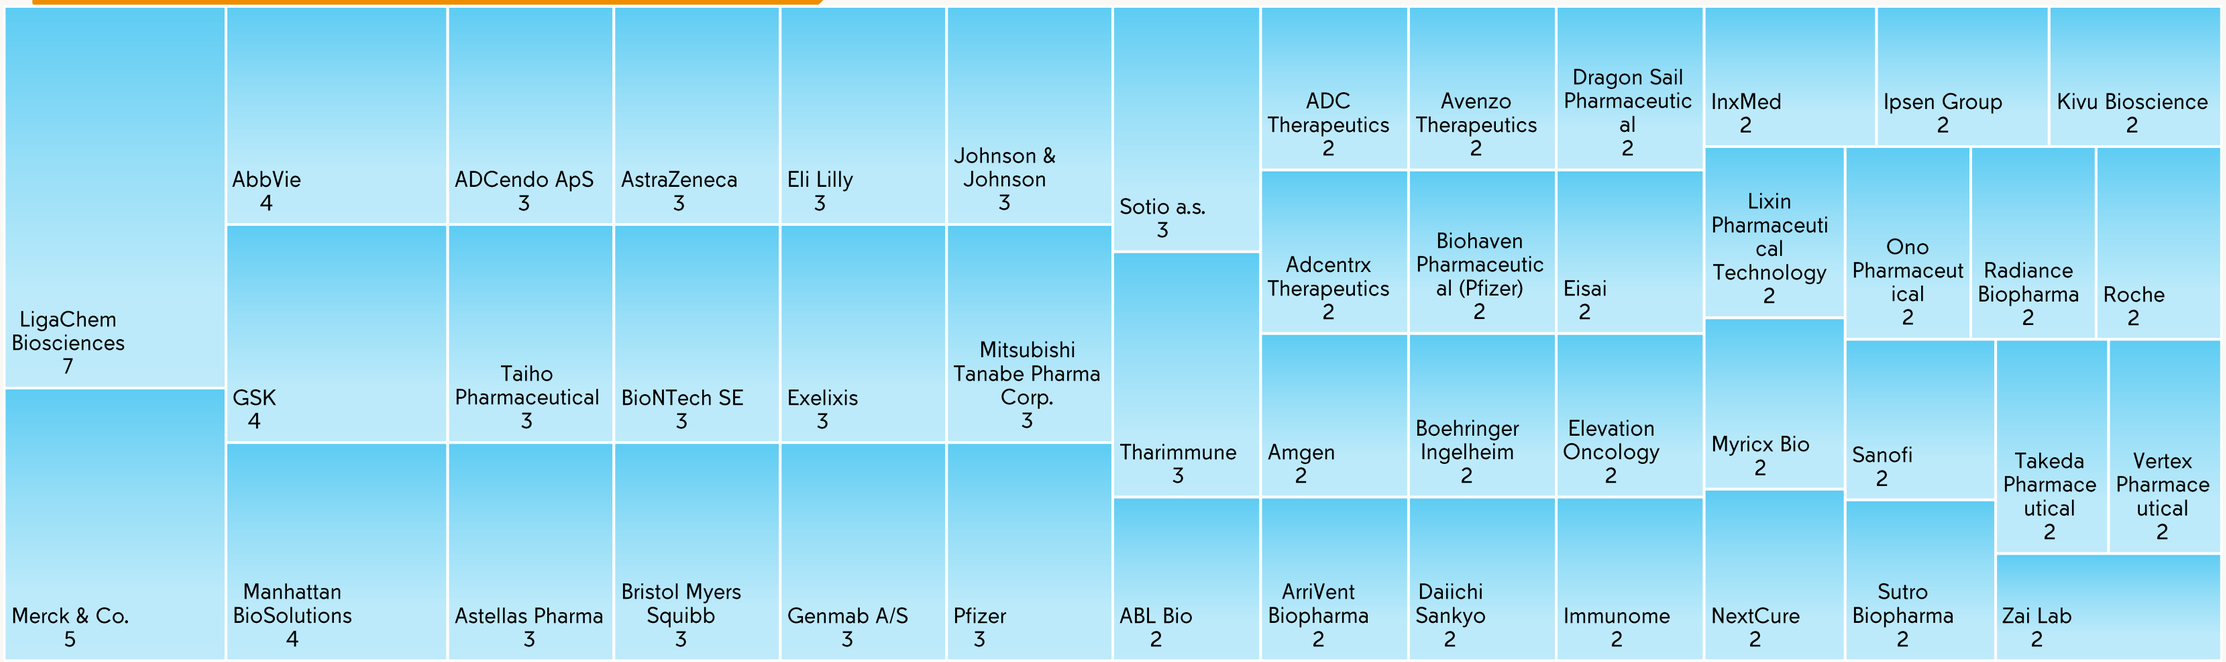

1. Development and Commercial License Deals Lead the Market
   - Most ADC partnerships (98 deals) focus on the development and commercialization license because companies seek access to late-stage or market-approved ADCs. This approach minimizes the risk and time needed to bring ADCs to patients by leveraging proven clinical and commercial value
2. Drive Towards Proven Late-Stage Assets
   - Companies prefer licensing advanced ADC candidates to capitalize on recent FDA approvals and strong clinical pipelines. Early-stage R&D deals are less favored due to higher uncertainty, making late-stage deals a faster route to revenue and competitive market positioning
3. Contract Service Deals Address Manufacturing Complexity
   - ADCs require sophisticated manufacturing processes involving complex conjugation and quality control steps. Many companies outsource these technical services to specialized contract organizations (like Lonza group, WuXi Biologics etc) to handle scale-up, regulatory compliance, and speed product delivery

INSIGHTS CORNER

Deals Analysis: Antibody Drug Conjugate

ADCs: Number of Deals per Company (2022-2025)

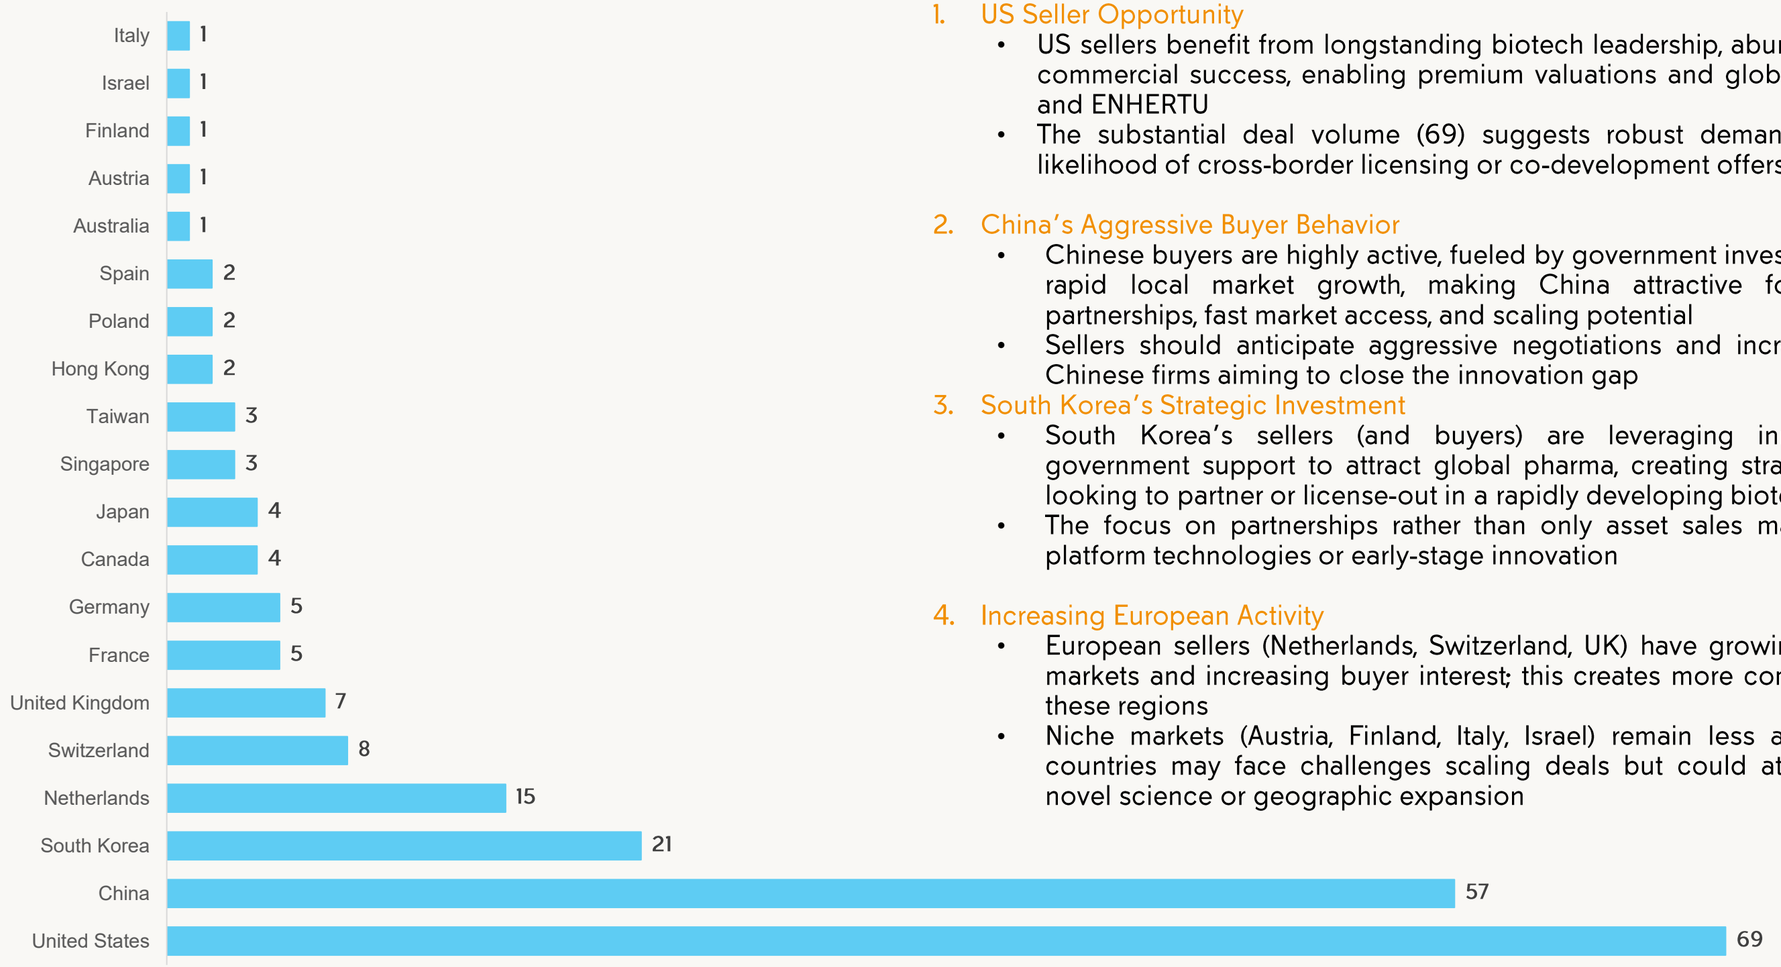

Note: 90+ Companies are there with 1 deal each.

1. Concentration of Deal Activity Among Leading Companies:
   - A handful of industry leaders like LigandChem Biosciences, Merck & Co., and Eli Lilly dominate the ADC deal landscape with multiple transactions, signaling these firms as proven innovators and attractive partners with validated pipelines and commercial potential
2. Diverse Opportunity Landscape:
   - The wide distribution of deals across numerous mid-sized and emerging biotech firms indicates a rich pipeline of novel ADC assets and platforms, offering buyers early access to high-growth investments and a broad spectrum of strategic partnership possibilities
3. Active Early-Stage and Specialty Players:
   - The significant number of companies with single deals highlights a vibrant early-stage market with numerous niche players, providing venture capital and private equity investors ideal entry points for high-risk, high-reward opportunities aligned with cutting-edge ADC innovation

INSIGHTS CORNER

Deals Analysis: Antibody Drug Conjugate

ADCs: Countries per deal (2022-2025)

1. US Seller Opportunity
   - US sellers benefit from longstanding biotech leadership, abundant VC funding, and proven ADC commercial success, enabling premium valuations and global interest in assets like ADCETRIS and ENHERTU
   - The substantial deal volume (69) suggests robust demand, diverse buyer pools, and high likelihood of cross-border licensing or co-development offers

2. China's Aggressive Buyer Behavior
   - Chinese buyers are highly active, fueled by government investment ("Made in China 2025") and rapid local market growth, making China attractive for sellers seeking volume-driven partnerships, fast market access, and scaling potential
   - Sellers should anticipate aggressive negotiations and increased competition from domestic Chinese firms aiming to close the innovation gap

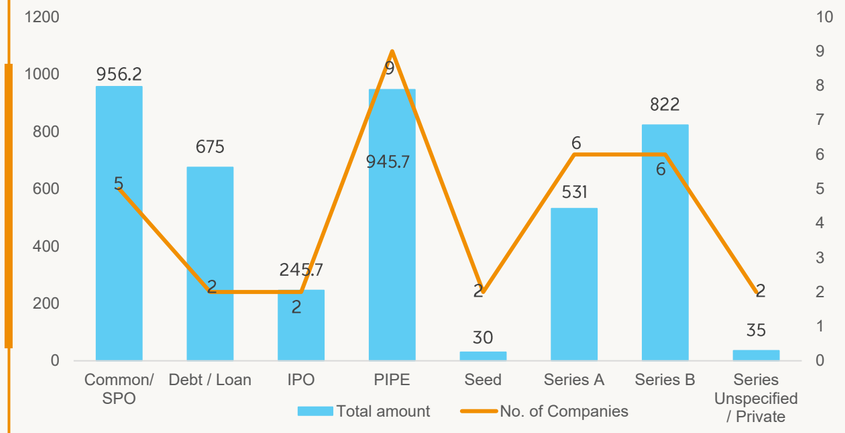

3. South Korea's Strategic Investment
   - South Korea's sellers (and buyers) are leveraging innovation-friendly regulations and government support to attract global pharma, creating strategic exit opportunities for sellers looking to partner or license-out in a rapidly developing biotech hub
   - The focus on partnerships rather than only asset sales may favor sellers with differentiated platform technologies or early-stage innovation

4. Increasing European Activity
   - European sellers (Netherlands, Switzerland, UK) have growing deal counts, signaling maturing markets and increasing buyer interest; this creates more competition and options for sellers in these regions
   - Niche markets (Austria, Finland, Italy, Israel) remain less active, meaning sellers from these countries may face challenges scaling deals but could attract interest from buyers seeking novel science or geographic expansion

INSIGHTS CORNER

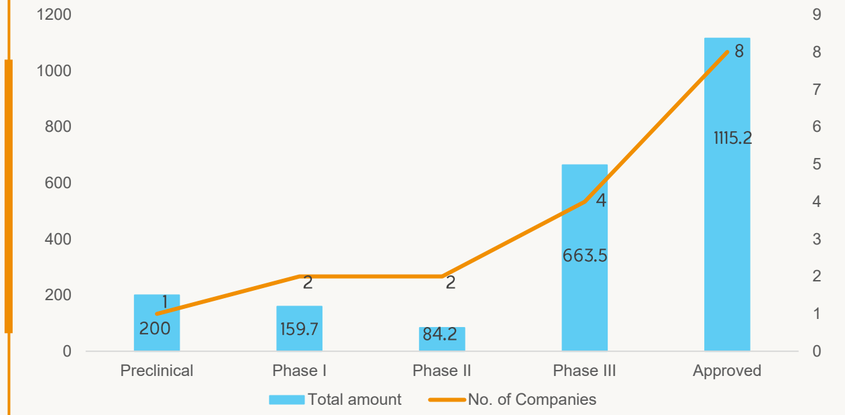

Funding Analysis: Antibody Drug Conjugate

ADCs: Round-Amount Distribution (2023-2025)

1. Strong funding in Common Stock and PIPE rounds shows investor confidence in later-stage ADC companies, often with validated pipelines or commercial potential. These rounds are typically used for expansion or late-stage R&D
2. Low funding in Seed and IPO rounds suggests early-stage ADC startups face barriers in attracting capital due to high scientific risk, while IPO markets may still be cautious or selective in biotech
3. Series A and B rounds receive steady investment, highlighting VC interest in scaling companies that have cleared early validation hurdles and are entering clinical development
4. Private/unspecified rounds still draw funds, possibly due to stealth-mode companies or strategic funding where details are undisclosed, reflecting flexible deal-making in the space

ADCs: Clinical Trial Stage Funding (2023-2025)

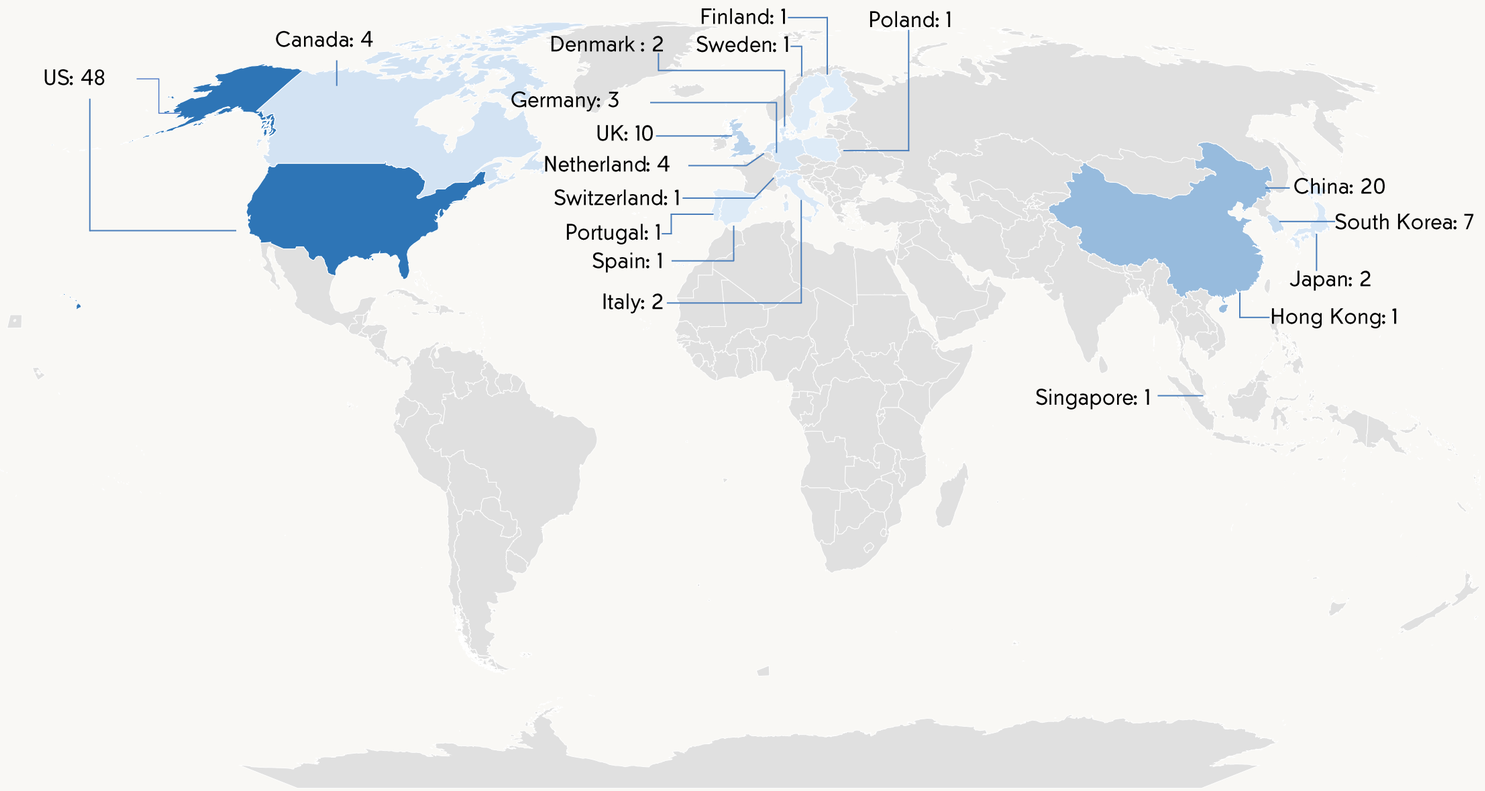

1. Significant funding at Phase III and Approved stages indicates that investors prefer lower-risk assets closer to market, where regulatory approvals are near and return on investment is more predictable
2. Limited funding in Preclinical and Phase I stages reflects the high failure rate of early-stage ADC programs and the long path to commercialization
3. Phase II sees a funding jump, suggesting it's a critical inflection point where proof-of-concept begins to emerge and investors start placing larger bets
4. Approved ADCs attract the highest backing, as investors shift focus to commercialization, scaling production, and market capture — often a phase of significant revenue potential

INSIGHTS CORNER

Companies Analysis: Antibody Drug Conjugate

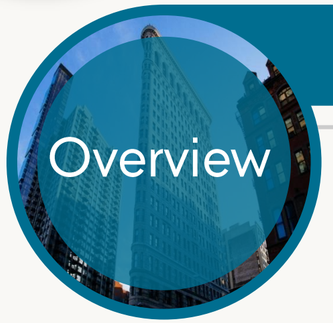

Top ADC Innovator's Geographical Distribution

1. The US stands out as the global leader for ADC company headquarters, driven by its mature biotech ecosystem, strong venture capital presence, and advanced research infrastructure
2. China's rapid growth in ADC company formation reflects its strategic investments in biotechnology and expanding domestic market demand for innovative therapies
3. Europe shows a diverse but fragmented biotech landscape, with multiple countries contributing to ADC innovation, likely due to strong scientific networks and collaborative frameworks across the region
4. The concentration of ADC companies in North America, Europe, and parts of Asia highlights the importance of regulatory support, funding availability, and scientific expertise in driving ADC innovation
5. South Korea and Japan's growing company presence indicates emerging biotech hubs in Asia, supported by government initiatives and increasing focus on biopharmaceutical development
6. Regions with less presence likely face challenges such as limited funding, infrastructure, or regulatory barriers that slow biotech company formation in this advanced therapeutic area
